

CLAIM OR CLAIMS

1. An apparatus for automatically wrapping the edges of aircraft interior panels with decorative laminate, comprising:
 - (a) an oven including a movable, translating support for the panel and the decorative laminate, a silicone blanket for overlying the support and for sandwiching the panel and laminate between the support and the blanket, and a heater; and
 - (b) a controller responsive to the oven reaching a set point temperature and, at such time, activating suction to draw the blanket in firm contact with the laminate to press the laminate against the panel, and, thereafter, translating the support to open a gap so that the blanket can move to wrap the laminate with bonding pressure around an edge of the panel and into contact with an adhesive on a back surface of the panel.
